Report in partnership with the **National Community Reinvestment Coalition**

Assessing the Double Burden: Examining Racial and Gender Disparities in Mortgage Lending

TABLE OF CONTENTS

Preface from the National Council of Negro Women

The National Council of Negro Women is proud to have partnered with the National Community Reinvestment Coalition to explore race and gender disparities in mortgage lending. We understand that this nation's economic crisis and the resulting decline in the global economy are the end-results of a foreclosure epidemic that had its roots in the targeting of communities of color for many years. While issues of race have long been examined in this realm, little is known about the interplay of both race and gender when it comes to the critical issues of financial access that is both fair and equal, and lending that is responsible and sustainable over the long-term. Are gender disparities in mortgage lending as stark as racial disparities have previously been shown to be? Do women of color have appreciably different experiences in mortgage lending than their white female counterparts? And in what ways do issues of class influence the experiences of borrowers across race and gender lines? This report answers these crucial questions and many more by examining the experiences of black, white, and Latino male and female borrowers in the 100 largest metropolitan areas in the United States.

Ultimately, this report finds that women's mortgage lending experiences are not monolithic. Instead, they are greatly determined by race, space, and class. A middle- to upper-income African-American woman in Raleigh, North Carolina, would most likely have a much different mortgage lending result than a similarly situated white woman in that same city or a Hispanic woman in Washington, DC. Yet, overall, this research uncovers an elevated risk of vulnerability to high-cost lending among women of color, with African-American women the most devastatingly impacted. Strikingly, this work finds that in more than four out of five metropolitan areas examined, middle- to upper-income African-American women were at least twice as likely to have received high-cost loans than their white female counterparts. Similarly, low- to moderate-income African-American women were at least twice as likely to have received high-cost loans in more than two-thirds of the metropolitan areas examined. The overwhelming pervasiveness of disparities in mortgage-lending outcomes meant that African-American women were the demographic group most likely to have received high-cost loans across both race and gender.

The story this report uncovers not only details issues surrounding women's experiences around loan costs but also provides data on women's representation among all mortgage

iii

holders. The findings also tell an equally compelling story. Among low- to moderate-income women, both African-American women and white women are more likely than their male counterparts to have received a mortgage loan (65% and 52% respectively). However, among middle- to upper-income women, African-American women alone hold this distinction, representing just over half (52%) of all home loans received by middle- to upper-income African Americans. Thus, within the black community as a whole, women are more likely than men to be mortgage holders. The experiences of African-American women differ dramatically from that of middle- to upper-income white women and Hispanic women in this regard, both of whom hold less than two-fifths (and falling) of all mortgage loans within their respective communities. Both white women and Hispanic women have suffered a decline in their share of home loans in 2007 compared with 2006, while African-American women have held steady over the same time period.

Taken together, the findings shared throughout this report tell an intriguing and important story; one that details the linkages between gender and race, and class and space. The National Council of Negro Women believes that sharing this story contributes greatly to the literature on mortgage lending and racial/ethnic and gender disparities in the US financial system. This contribution comes at a time when recent events have significantly eroded the accumulation of wealth among many who have only in recent history been afforded the opportunity to forge their own paths towards the American dream. It is important to remember that just as communities of color had to fight discriminatory practices and policies over the course of much of this nation's history just to be afforded the opportunity of homeownership, so too have women, who only until about 40 years ago were legally barred from the right to purchase property in their own names exclusively. For these groups especially, the housing/foreclosure crisis has dealt a particularly stinging blow. In order to rebound, it is necessary to understand where we stand so that we can craft the most effective strategies to begin the task of moving forward in a way that does not recreate the mistakes of the past. This work plays a key role in underscoring disparities in lending in an effort to broaden the circle of opportunity for communities of color, and develop short-term and long-term strategies to close the racial/ethnic and gender gaps in financial inclusion, economic mobility, and wealth creation for women and families across this nation.

National Council of Negro Women

Executive Summary

The purpose of this study is to identify potential lending disparities in gender and race among African-American, Hispanic, and Caucasian borrowers. Credit Suisse recently released a report estimating 9 million foreclosures over the next four years assuming an 8 percent unemployment rate. With the national unemployment rate at an uncomfortable 9.4 percent—the highest rate in more than two decades—it now seems that the US economy can certainly expect millions more foreclosures given the continued rise in unemployment.[1] While this statistic suggests the spread of the foreclosure crisis across broad segments of the US population, this report finds that the first groups to disproportionately experience high rates of foreclosure are minorities. As the foreclosure crisis spreads to suburban areas, this study suggests that middle- and upper-income minorities will continue to experience a disproportionate impact, which is especially pronounced for African-American women in particular.

NCRC observed striking racial/ethnic disparities in high-cost lending practices. If a consumer is a minority, particularly an African American or a Hispanic, the consumer is most at risk for receiving a poorly underwritten high-cost loan. In addition, middle-class or upper-class status does not shield minorities from receiving problematic high-cost loans. In fact, NCRC observed that racial differences in lending increase as income levels increase. In other words, middle- and upper-income minorities are more likely than their middle- and upper-income white counterparts to receive high-cost loans. The same is also true for low- and moderate-income minorities compared with their low- and moderate-income white counterparts.

Using 2007 *Home Mortgage Disclosure Act* (HMDA) data (the most recent data available), NCRC found that middle- and upper-income African-American females were at least twice as likely to receive high-cost loans as middle- and upper-income white females in more

than 84 percent of the metropolitan areas examined. In addition, low- and moderate-income African-American females were at least twice as likely to receive high-cost loans as low- and moderate-income white females in 70 percent of the metropolitan areas examined.[2]

NCRC found that middle- and upper-income Hispanic females were at least twice as likely to receive high-cost loans as middle- and upper-income white females in almost 62 percent of the metropolitan areas examined. In addition, low- and moderate-income Hispanic females were at least twice as likely as low- and moderate-income white females to receive high-cost loans in 32 percent of the metropolitan areas examined. The trend of racial/ethnic disparities in lending as income levels increased was also observed when comparing African-American or Hispanic males with their white counterparts (see Figures 3 and 4).

This study has findings strikingly similar to the previous year's. Using 2006 HMDA data, NCRC's 2008 study "Income is No Shield Against Racial Differences in Lending II" found that middle- and upper-income African Americans were at least twice as likely as middle- and upper-income whites to receive high-cost loans in 71.4 percent of the metropolitan areas examined during 2006.[3] NCRC also found that low- and moderate-income African Americans were at least twice as likely as low- and moderate-income whites to receive high-cost loans in 47.3 percent of the metropolitan areas examined that same year.

NCRC did not observe noticeable differences in the percentage of high-cost loans to males and females. In 2007, for example, 34.8 percent of loans to middle- and upper-income African-American males were high-cost. That same year, 33.7 percent of loans to middle- and upper-income African-American females were high-cost. Yet, females were a larger portion of the African-American borrower pool than males. In 2007, middle- and upper-income African-American females received 39,115 high-cost loans compared with 37,698 high-cost loans to middle- and upper-income African-American males. The difference is even more striking for low- and moderate-income African-American borrowers. Low- and moderate-income African-American females received 43,051 high-cost loans—almost twice as many as the 24,512 high-cost loans that low- and moderate-income African-American males received.

NCRC ranked metropolitan areas on a series of fair lending indicators to assess differences in high-cost lending to minorities and whites while controlling for income level. A ranking score of 1 indicates the greatest racial/ethnic disparity in high-cost lending and higher ranking scores indicate fewer disparities.

The basic formula for calculating the high-cost disparity ratio in this report:

$$\text{High-Cost Disparity Ratio} = \frac{\text{\% of all loans received by minority borrowers that were high-cost}}{\text{\% of all loans received by white borrowers that were high-cost}}$$

2

[2] The year 2007 is the most recent year for which *Home Mortgage Disclosure Act* (HMDA) data is publicly available as of the release of this report. NCRC observed lending patterns in metropolitan statistical areas (MSAs) or metropolitan divisions (MD), using the boundaries provided in HMDA data issued by the Federal Financial Institutions Examination Council (FFIEC). Metropolitan areas in this report refer to MSAs and MDs.

[3] See http://www.ncrc.org/images/stories/pdf/research/income%20is%20no%20shield%20ii.pdf.

Of approximately 100 metropolitan areas examined nationwide, NCRC found that the top 10 metropolitan areas with the greatest racial/ethnic lending disparities are:

1. Raleigh-Cary, NC
2. Minneapolis-St. Paul-Bloomington, MN-WI
3. Milwaukee-Waukesha-West Allis, WI
4. Bridgeport-Stamford-Norwalk, CT
5. Washington-Arlington-Alexandria, DC-MD-VA-WV
6. Chicago-Naperville-Joliet, IL
7. Cleveland-Elyria-Mentor, OH
8. Hartford-West Hartford-East Hartford, CT
9. Oakland-Fremont-Hayward, CA
10. Philadelphia, PA

In theory, high-cost loans compensate lenders for the added risk of lending to borrowers with imperfect credit histories. However, racial/ethnic disparities in lending (even when controlling for gender and income levels) suggests that more minorities are receiving high-cost loans than is justified based on creditworthiness. Previous studies conducted by NCRC and others suggest that minorities are, in fact, receiving a disproportionately large amount of high-cost loans, after controlling for creditworthiness and other housing market factors.

When minorities receive a disproportionate amount of high-cost loans, they lose substantial amounts of equity through higher payments to their lenders. In addition, they are more exposed to irresponsibly underwritten Adjustable Rate Mortgages (ARM) loans that are likely to default and result in foreclosure. Since racial disparities have been persistent over several years, NCRC is working with Congress, the Obama Administration, and other stakeholders to enact bold programmatic and policy reforms. NCRC believes that community groups and financial institutions should engage in more partnerships to create counseling programs and lending products that are fairly priced and affordable for working Americans. Therefore, NCRC recommends that Congress and the Obama Administration work together to enact a broad-scale foreclosure prevention and loan modification program that protects low- and moderate-income and middle-income communities against widespread foreclosures. NCRC also recommends that Congress pass comprehensive anti-predatory lending legislation that prohibits steering or price discrimination and outlaws a wide range of equity-stripping and abusive practices. To encourage more prime or market-rate lending to working families and communities, NCRC recommends that Congress pass the *Community Reinvestment Modernization Act of 2009* (H.R. 1479). After Congress enacts comprehensive anti-predatory lending legislation and CRA modernization, it is critical that federal and state regulatory agencies significantly strengthen the rigor of their anti-predatory and fair lending oversight and enforcement.

Literature Review

A substantial body of research documents significant disparities in loan-pricing based on the race/ethnicity and age of neighborhood residents. Less work has been conducted on disparities based on gender; some Federal Reserve studies suggest that disparities by gender are not substantial. Racial/ethnic disparities in lending are due to a combination of discrimination, market failure, and a variety of other factors.[4] This is problematic because discrimination and market failure impedes wealth-building and the creation of sustainable homeownership opportunities for residents in traditionally underserved neighborhoods.

Definition of Subprime and Predatory Lending

Significant disparities in loan-pricing reflect the growth of subprime lending. A subprime or high-cost loan has an interest rate higher than prevailing and competitive rates in order to compensate for the added risk of lending to a borrower with imperfect credit. NCRC defines a predatory loan as an unsuitable loan designed to exploit vulnerable and unsophisticated borrowers. Predatory loans are a subset of subprime and non-traditional prime loans.[5] A predatory loan has one or more of the following features: 1) charges more in interest and fees than is required to cover the added risk of lending to borrowers with imperfect credit; 2) contains abusive terms and conditions that trap borrowers and lead to increased indebtedness; 3) does not take into account the borrower's ability to repay the loan; and 4) violates fair lending laws by targeting women, minorities, and communities of color.

The Impacts of Steering

The steering of borrowers into high-cost loans results in lost home equity and has contributed to inequalities in wealth-building, which is especially pronounced in minority communities. In 2004, the Federal Reserve Survey of Consumer Finances reports that the median net worth of minorities was 17.6 percent of that for all other communities. It also reports that the median net worth for African Americans was nearly the same in 2004 at $20,400 as it was in 2001 at $20,300.[6] By 2007, the median net worth of African Americans had declined to $17,000.[7]

Since subprime loans often cost $50,000 to $100,000 more than comparable prime loans, a neighborhood that receives a disproportionate number of subprime loans will lose a significant amount of home equity and wealth. Using a mortgage calculator from

5

---

[4] The disparities discussed in this report reflect a number of factors including income, wealth, credit rating, and many others. Discrimination, of course, remains a significant factor. Several studies discussed below have found that even when controlling for credit-related factors, disparities still persist. The disparities in this report do not necessarily reveal levels of discrimination in the marketplace; but they do reveal the presence of ongoing barriers associated with socio-economic factors.

[5] A non-traditional loan is a loan that does not have a standard fixed interest rate and/or does not have a traditional 30-year term. An example of a non-traditional loan is an interest-only loan in which the borrower only has to make interest payments during a specified time period of the loan. An option ARM loan features a number of payment options; under one option the borrower does not even have to pay the monthly interest that is due. A substantial number of subprime loans are non-traditional loans but so are a significant number of prime loans. Option ARM loans, for example, are almost always prime loans.

Bankrate.com, a $140,000 30-year mortgage with a prime rate of 6.25% costs about $862 a month or about $310,320 over the life of the loan. In contrast, a 30-year subprime loan with an interest rate of 8.25% costs $1,052 a month or approximately $378,637 over the life of the loan (the interest rates in this example correspond approximately to the rates in 2007, the year for which the lending data are analyzed for this report). The difference in total costs between the 6.25% prime loan and the 8.25% subprime loan is $68,317. Finally, a 30-year subprime loan at 9.25% costs $1,152 per month and $414,630 over the life of the loan. The difference in total costs between a 6.25% prime loan and a 9.25% subprime loan is $104,310. For a borrower who is qualified for a prime loan but receives a subprime loan, the total loss in home equity can easily amount to $50,000-$100,000. This amount represents financial resources that were transferred to the lender, when they could have been used to support the financial needs of the borrower.

The home equity loss for an entire neighborhood can be tremendous in the context of the previous example. If 15 percent, or 300 families, in a predominantly minority census tract with 2,000 households receive subprime loans though they qualified for prime loans (15 percent of families that are inappropriately steered into subprime loans is a realistic figure based on existing research) pay $50,000 more over the life of the loan than they should have (the $50,000 figure is conservative based on the calculations immediately above), in total, the 300 families would have paid lenders $15 million more than they would have had they received prime loans. This $15 million in purchasing power could have supported economic development and wealth-building opportunities in their neighborhood. For even one neighborhood disproportionately laden with subprime loans, the magnitude of lost wealth due to racial/ethnic lending disparities and/or discrimination is stark; across the country, the lost wealth is staggering.

Larger payments to lenders and wealth losses associated with foreclosure are destructive outcomes of steering borrowers into subprime loans. Subprime loans, particularly adjustable rate mortgage (ARM) subprime loans, have significantly higher default and delinquency rates than prime loans. According to a recent Mortgage Bankers Association survey, the foreclosure start rates for prime fixed-rate, prime ARM, and subprime ARM loans were .34 percent, 1.77 percent, and 6.47 percent respectively.[8] The Federal Reserve Board estimated that 28 percent of ARM subprime loans were seriously delinquent by May of 2008, or five times the mid-2005 level.[9] Many of these subprime ARM loans are delinquent and/or in foreclosure because they were not underwritten carefully and contain several risk factors (39 percent have low or no income documentation, 74 percent of them have prepayment penalties, 79 percent were issued to borrowers with FICO scores below 660, and the median debt-to-income ratio was a high 41 percent).[10] The policy group United for a Fair Economy multiplies foreclosure estimates provided by the Center for Responsible Lending by subprime loan shares calculated by NCRC to estimate that people of color can expect to lose between $164 billion to $213 billion of dollars over an 8-year period.[11]

6

Evidence of Steering

A considerable body of research demonstrates that the steering of minority borrowers into high-cost loans is widespread. More recent research demonstrates that concentrations of foreclosure in minority neighborhoods have followed concentrations of subprime loans in those neighborhoods.

In NCRC's 2004 study "Broken Credit System," NCRC selected 10 large metropolitan areas for analysis: Atlanta, Baltimore, Cleveland, Detroit, Houston, Los Angeles, Milwaukee, New York, St. Louis, and Washington, DC. NCRC obtained creditworthiness data on a one-time basis from a large credit bureau. As expected, the number of subprime loans increased as the amount of neighborhood residents in higher credit-risk categories increased. After controlling for risk and housing market conditions, however, the race and age composition of a neighborhood had an independent and strong effect. In particular:

- The level of refinance subprime lending increased as the portion of African Americans in a neighborhood increased in 9 of the 10 metropolitan areas. In the case of home purchase subprime lending, the African-American composition of a neighborhood raised lending in 6 metropolitan areas.

- The impact of the age of borrowers was strong in refinance lending. In 7 metropolitan areas, the portion of subprime refinance lending increased solely when the number of neighborhood residents over the age of 65 increased.

In another study conducted in 2006, "Homeownership and Wealth Building Impeded," NCRC found that racial/ethnic disparities in high-cost lending were greater for upper-income borrowers than lower-income borrowers across the country. High-cost loans constituted a high 41.9 percent of all refinance loans to low- and moderate-income African Americans. In contrast, subprime loans were 19.2 percent of refinance loans to low- and moderate-income whites in 2004. Low- and moderate-income African Americans were 2.2 times more likely than low- and moderate-income whites to receive high-cost loans. Even for middle- and upper-income African Americans, high-cost loans constituted a large percentage (30.2 percent) of all refinance loans. Moreover, the subprime share of loans to middle- and upper-income African Americans was 2.7 times larger than the subprime share of loans to middle- and upper-income whites.

NCRC's findings are consistent with a wide variety of research on subprime lending. A study conducted by Freddie Mac analysts finds that two-thirds of subprime borrowers were not satisfied with their loans, while three-quarters of prime borrowers believed they had received fair rates and terms.[12] In previous years, Freddie Mac and Fannie Mae reported that approximately one-third to one-half of borrowers who qualify for low-cost loans receive subprime loans.[13] The Federal Reserve also released analyses of the 2004 and 2005 HMDA data that revealed racial/ethnic disparities in lending, even after

controlling for income levels, loan types, and geographical areas.[14] Dan Immergluck, a senior consultant at the Woodstock Institute, is one of the first researchers to document the "hypersegmentation" of lending by race/ethnicity of neighborhood.[15]

Paul Calem of the Federal Reserve, and Kevin Gillen and Susan Wachter of the Wharton School also use credit-scoring data to conduct econometric analysis scrutinizing the influence of credit scores, demographic characteristics, and economic conditions on the level of subprime lending. Their study found that after controlling for creditworthiness and housing market conditions, the level of subprime refinance and home purchase loans increased in a statistically significant manner as the portion of African Americans increased on a census tract level in Philadelphia and Chicago.[16] The Center for Responsible Lending also used the 2004 HMDA data with pricing information to reach the same troubling conclusions that racial disparities remain after controlling for creditworthiness.[17]

A second wave of studies uses foreclosure and HMDA data on a neighborhood level to demonstrate that concentrations of foreclosures have followed concentrations of subprime loans in minority communities. The Reinvestment Fund, for instance, shows that in 2006, minority neighborhoods in Philadelphia received the greatest percentages of subprime loans: 57.7 percent of the loans were subprime for communities with over 80 percent minorities. Predictably, the Reinvestment Fund found that African-American neighborhoods (with over 80 percent African-American households) had 29.6 percent of Philadelphia's housing stock but 38.7 percent of the city's foreclosures. In contrast, foreclosures in white neighborhoods are more in line with their share of the city's housing units.[18]

Kristopher Gerardi and Paul S. Willen of the Boston Federal Reserve show that the gains in homeownership among minorities, particularly African Americans, due to increased subprime loans are offset by increasing foreclosures of subprime loans in Boston. They report that subprime loans held by African Americans and Hispanics have riskier attributes than those held by whites, such as higher loan-to-value ratios and debt-to-income ratios. Approximately 15 percent of African-American subprime loans issued in 2005 ended in foreclosure in 2007, compared with 10 percent for Hispanics, and 6.5 percent for whites. Gerardi and Willen also found that homeowners who take out a subprime loan are approximately five times more likely to lose their homes to foreclosure.[19]

8

The Cleveland Federal Reserve Bank has also found a strong correlation among race of neighborhood, subprime lending, and foreclosures. Examining Cuyahoga County, Lisa Nelson of the Cleveland Federal Reserve Bank documents that the quartile of neighborhoods with the highest foreclosure rate (19 percent) also had the highest percentage of high-cost loans (63 percent), as well as the highest percentage of African Americans (73.7 percent).[20]

While minority communities were probably the epicenter of the foreclosure crisis, evidence suggests that the crisis is spreading from inner-core minority neighborhoods towards suburban communities. The Cleveland Federal Reserve indicates that a comparison of 2007 with 2006 foreclosure filings in Cuyahoga County shows that the fastest growth in foreclosures occurred in upper-income neighborhoods (mostly suburban census tracts). In a recent paper on real estate-owned properties (REOs or foreclosed properties owned by lending institutions), Immergluck comments that the fastest growth in REOs are those associated with prime loans, meaning that it is possible that the spatial patterns of REOs are spreading towards the suburbs of metropolitan areas.[21]

Even if the foreclosure crisis spreads from inner-city minority areas to more suburban areas, those who suffer most in the wake of the crisis may still be disproportionately from minority communities. As this report illustrates, middle- and upper-income African Americans and Hispanics remain much more likely to receive high-cost loans than middle- and upper-income whites. In addition, NCRC's report from the summer of 2008 "Income is No Shield against Racial Differences in Lending II" reveals that middle- and upper-income borrowers in minority neighborhoods are considerably more likely than middle- and upper-income borrowers in white neighborhoods to receive high-cost loans. This suggests that as the crisis spreads towards suburban areas, suburban minority communities, including middle- and upper-income ones, appear to be the next in line for rising rates of mortgage default and foreclosure.

A majority of previous studies have focused on race and income but not gender. The relatively sparse work devoted to gender usually does not show significant disparities, such as the most recent review of HMDA data conducted by Federal Reserve economists Robert Avery and Glenn Canner.[22] As detailed below, this study shows relatively few disparities when considering the percentages of loans received by females and males. Yet, for African-American females, the foreclosure crisis will continue to have a disproportionate impact since African-American females are a larger portion of the African-American borrower pool than African-American males.

9

Data Analysis

Methodology

NCRC analyzed the 2007 *Home Mortgage Disclosure Act* (HMDA) data for metropolitan areas across the country. The 2007 HMDA data are the most recent publicly available data on an industry-wide basis. Furthermore, a section of this report reviewed national lending trends comparing 2006 and 2007 HMDA data. NCRC considered loans for traditional single-family homes occupied by the borrowers of the loans (investor-owned properties were not considered). The home loan data used were for home purchase, refinance, and home improvement lending (only first liens). HMDA data include pricing information for high-cost loans, thereby making it possible to differentiate between prime and high-cost loans. (The HMDA definition for high-cost loans are first-lien loans with an interest rate three percentage points or higher than the Treasury rate.)

NCRC controlled for income levels to minimize their effects on lending outcomes.[23] While persistent racial/ethnic disparities across all income levels do not prove discrimination, it would appear that policymakers and stakeholders could take action to narrow particularly large disparities between middle- and upper-income minorities and whites. Large disparities at all income levels, particularly middle- and upper-income levels, suggest a lack of competition among lenders and other market barriers that can be reduced through concerted action. Therefore, NCRC believes that it is important that policymakers and stakeholders carefully consider any differences by race/ethnicity or gender that persist for middle- and upper-income borrowers.

National Analysis of Lending

As gender-based disparities in lending were not readily observable, NCRC focused its analysis on racial and ethnic disparities in lending experienced by low- and moderate-

---

[23] Income levels correspond to CRA-defined income levels. Low- and moderate-income are income levels up to 80 percent of area median income; middle- and upper-income are 80 percent and higher of area median-income.

income borrowers separately from middle- and upper-income borrowers. Both 2006 and 2007 HMDA data revealed a fairly equal pattern of both prime and high-cost lending across genders. Namely, when keeping the racial and ethnic background constant (that is, comparing males and females from the same race or ethnicity), there were no significant disparities in prime and high-cost lending patterns.

This is illustrated in Tables 1, 2, 3, and 4 (see Appendix) where the gender disparity ratio (the percentage of loans to females divided by the percentage of loans to males) is close to 1, indicating that females have received roughly the same proportion of prime and high-cost loans as males. For example, in 2006, 49.4 percent of the loans received by African-American middle- and upper-income females were high-cost; in the same year, 51.3 percent of the loans received by African-American middle- and upper-income males were high-cost. Our findings reveal that African-American middle- and upper-income females were .96 times as likely to receive high-cost loans as African-American middle- and upper-income males.

Comparing lending patterns among different races and ethnicities, however, revealed a different outcome. Racial/ethnic disparities in lending were much more pronounced regardless of the income level of the borrower. In 2007, low- and moderate-income African-American females were more than twice as likely to receive high-cost loans as were low- and moderate-income white females. Moreover, disparities became more pronounced as

Figure 5

High-cost disparity ratio: African-American females were more than twice as likely to receive high-cost loans as white females
Figure 6

High-cost disparity ratio: African-American males were more than twice as likely to receive high-cost loans as white males
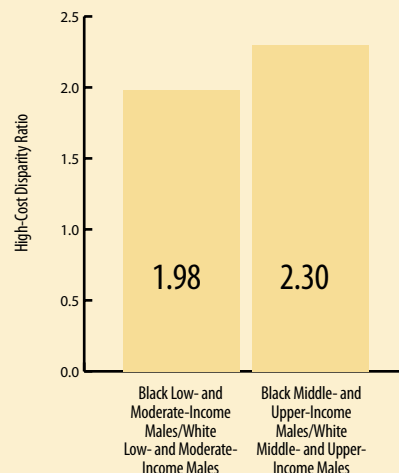

income levels increased, with middle- and upper-income African-American females being approximately 2.4 times more likely to receive high-cost loans than middle- and upper-income white females. In other words, 33.7 percent of the loans received by middle- and upper-income African-American females were high-cost, while only 14.3 percent of the loans to middle- and upper-income white females were high-cost. NCRC observed similar trends in male borrowers. Middle- and upper-income African-American males were 2.3 times more likely to receive a high-cost loan than middle- and upper-income white males (see Appendix Table 5). In addition, low- and moderate-income African-American males were twice as likely to receive high-cost loans as their low- and moderate-income white counterparts.

There were observable disparities in lending between low- and moderate-income Hispanics and low- and moderate-income whites (see Appendix Table 5). Disparities in home lending were more striking as income levels increased. In 2007, middle- and upper-income Hispanic females were more than twice as likely to receive high-cost loans as middle- and upper-income white females. In that same year, low- and moderate-income Hispanic females were 1.5 times more likely than low- and moderate-income white females to receive high-cost loans (see Appendix Table 5).

Racial and ethnic disparities in home lending slightly increased from 2006 to 2007 (see Appendix Tables 5 and 6). That is, the high-cost disparity ratio between middle- and upper-income African-American females vs. middle- and upper-income white females slightly increased; the high-cost disparity ratio between middle- and upper-income African-American males vs. middle- and upper-income white males slightly increased; the high-cost disparity ratio between middle- and upper-income Hispanic males vs. middle- and upper-income white males slightly increased; and the high-cost disparity ratio between middle- and upper-income Hispanic females vs. middle- and upper-income white females slightly increased.

As Appendix Tables 7 and 8 reveal, the current mortgage crisis is affecting low- and moderate-income African-American females more than low- and moderate-income African-American males because low- and moderate-income African-American females are a larger portion of the borrower pool (see Figure 7). Low- and moderate-income African-American females received approximately 65 percent of all loans to low- and moderate-income African-American borrowers in 2007, which caused African-American females to suffer financial losses disproportionately as a result of the foreclosure crisis.

Figure 7

Home loans to low- and moderate-income African-American borrowers, 2007

Low- and Moderate-Income African-American Males
35%

Low- and Moderate-Income African-American Females
65%

12

During 2007, African-American low- and moderate-income females and males received 43,051 and 24,512 high-cost loans, respectively (see Appendix Table 1). While the percentage of high-cost loans received by both groups of borrowers did not differ significantly, the sheer number of high-cost loans received by both groups was quite different.

Interestingly, Hispanic borrowers showed an opposite trend.   Middle- and upper-income Hispanic male borrowers comprised a larger portion of the borrower pool for middle- and upper-income Hispanics (see Appendix Tables 7 and 8). The same trend applies to low- and moderate-income Hispanic males, who comprise a larger portion of the borrower pool for low- and moderate-income Hispanics.

Fair Lending Analysis by Metropolitan Area

In 2007, NCRC examined lending disparities between minorities and whites, while controlling for income and gender, across various metropolitan areas. NCRC developed eight fair lending indicators which assess the extent of differences in the percentage of high-cost loans to whites and males vs. minorities and females. Metropolitan areas with fewer than 50 prime loans or 50 high-cost loans for any group of borrowers were excluded from one or more of the eight fair lending indicators because of insufficient data from which to draw meaningful conclusions. For each of the fair lending indicators, the metropolitan areas were ranked for lending disparities (see page 2). A final ranking table averages the ranks each metropolitan area received for the fair lending indicators. (**Note**: A metropolitan area received a final ranking only if it could be ranked on five of the eight fair lending indicators. For example, if a metropolitan area could be ranked on fair lending indicators 1-5, then it would receive a final ranking.)

NCRC considered the following fair lending indicators:
1. **Low- and moderate-income African-American females vs. Low- and moderate-income white females** (109 metropolitan areas examined; a score of 1 indicates the greatest racial/ethnic disparity in lending and a score of 109 indicates the least racial/ethnic disparity in lending).

2. **Low- and moderate-income Hispanic females vs. Low- and moderate-income white females** (50 metropolitan areas examined; a score of 1 indicates the greatest racial/ethnic disparity in lending and a score of 50 indicates the least racial/ethnic disparity in lending).

3. **Middle- and upper-income African-American females vs. Middle- and upper-income white females** (96 metropolitan areas examined; a score of 1 indicates the greatest racial/ethnic disparity in lending and a score of 96 indicates the least racial/ethnic disparity in lending).

4. **Middle- and upper-income Hispanic females vs. Middle- and upper-income white females** (63 metropolitan areas examined; a score of 1 indicates the greatest racial/ethnic disparity in lending and a score of 63 indicates the least racial/ethnic disparity in lending).

13

5. **Low- and moderate-income African-American males vs. Low- and moderate-income white males** (77 metropolitan areas examined; a score of 1 indicates the greatest racial/ethnic disparity in lending and a score of 77 indicates the least racial/ethnic disparity in lending).

6. **Low- and moderate-income Hispanic males vs. Low- and moderate-income white males** (61 metropolitan areas examined; a score of 1 indicates the greatest racial/ethnic disparity in lending and a score of 61 indicates the least racial/ethnic disparity in lending).

7. **Middle- and upper-income African-American males vs. Middle- and upper-income white males** (96 metropolitan areas examined; a score of 1 indicates the greatest racial/ethnic disparity in lending and a score of 96 indicates the least racial/ethnic disparity in lending).

8. **Middle- and upper-income Hispanic males vs. Middle- and upper-income white males** (97 metropolitan areas examined; a score of 1 indicates the greatest racial/ethnic disparity in lending and a score of 97 indicates the least racial/ethnic disparity in lending).

Lending to Low- and Moderate-Income African-American Females vs. Low- and Moderate-Income White Females

The lending analysis of low- and moderate-income African-American females vs. white females reveals significant disparities in lending (see Appendix Table 9). All 109 metropolitan areas that had enough observations in order to be ranked in our analysis had a high-cost disparity ratio greater than 1. Almost 70 percent of all metropolitan areas included in this analysis (76 out of 109) had a high-cost disparity ratio of two or above. This indicates that low- and moderate-income African-American females were more than twice as likely to receive high-cost loans than low- and moderate-income white females in the majority of metropolitan areas examined. In 2007, low- and moderate-income African-American females were more than three times as likely to receive high-cost loans compared with low- and moderate-income white females in the following 10 metropolitan areas:

1. Milwaukee-Waukesha-West Allis, WI
2. Wilmington, NC
3. Chicago-Naperville-Joliet, IL
4. Harrisburg-Carlisle, PA
5. Durham, NC
6. Raleigh-Cary, NC
7. Charleston-North Charleston, SC
8. Sarasota-Bradenton-Venice, FL
9. Hartford-West Hartford-East Hartford, CT
10. Lafayette, LA

14

Figure 8

Five MSAs with largest disparities in high-cost lending to Low- and moderate-income
African-American vs. Low- and moderate-income White Females

Disparity Ratio is % African-American High Cost Loans / % White High Cost Loans

Note: LMI here stand for Low- and Moderate-Income
Almost 52 percent of all the loans received by low- and moderate-income African-American
females in Milwaukee-Waukesha-West Allis, Wisconsin, were high-cost, compared with
only 14 percent of loans received by low- and moderate-income white females. The high-
cost lending disparity ratio for low- and moderate-income African-American females vs.
low- and moderate-income white females was 3.8, indicating that low- and moderate-
income African-American females were more than three times as likely to receive high-cost
loans than their low- and moderate-income white counterparts.

In Wilmington, North Carolina, low- and moderate-income African-American females were
more than 3.5 times as likely to receive high-cost loans as were low- and moderate-income
white females (almost 40 percent of the loans to African-American females were high-cost
vs. only 11.2 percent of high-cost loans to low- and moderate-income white females). In
addition, 38 metropolitan areas had a high-cost disparity ratio of 2.5 or above, indicating
that low- and moderate-income African-American females in these metropolitan areas
were more than 2.5 times as likely to receive high-cost loans than their low- and moderate-
income white counterparts (see Appendix Table 9).

**Lending to Low- and Moderate-Income Hispanic Females vs. Low- and
Moderate-Income White Females**

Similar trends were observed when examining racial/ethnic lending disparities between low-
and moderate-income Hispanic females vs. white females. All 50 metropolitan areas that
had enough observations in order to be ranked in our analysis had a high-cost disparity ratio
greater than one, indicating an increased likelihood of low- and moderate-income Hispanic
females receiving high-cost loans compared with their white low- and moderate-income
counterparts (see Appendix Table 10). In addition, low- and moderate-income Hispanic

Figure 9

females were at least twice as likely to receive high-cost loans than their low- and moderate-income white counterparts in 16 metropolitan areas.

Figure 9 illustrates the five metropolitan areas with the greatest disparities in racial/ethnic high-cost lending to low- and moderate-income Hispanic females vs. low- and moderate-income white females.

Lending to Middle- and Upper-Income African-American Females vs. Middle- and Upper-Income White Females

Two of the metropolitan areas (Raleigh-Cary, NC, and Durham, NC) examined had a high-cost disparity ratio greater than four between middle- and upper-income African-American females and middle- and upper-income white females. This indicates that middle- and upper-income African-American females were more than four times as likely to receive high-cost loans as were middle- and upper-income white females. Most metropolitan areas examined (84 percent) had a high-cost disparity ratio of two or above, indicating that middle- and upper-income African-American females were more than twice as likely to receive high-cost loans compared with their middle- and upper-income white counterparts (see Appendix Table 11). Our findings also suggest that racial/ethnic disparities in lending grew larger as income levels increased. (As previously discussed, a lower percentage of metropolitan areas [70 percent] had a high-cost disparity ratio of two or above when comparing low- and moderate-income African-American and white females.)

Figure 10 illustrates the five metropolitan areas with the greatest racial/ethnic disparities in high-cost lending to middle- and upper-income African-American and white females.

Figure 10

Five MSAs with largest disparities in high-cost lending to Middle- and upper-income African-American vs. Middle- and upper-income White Females

Note: LMI here stand for Low- and Moderate-Income
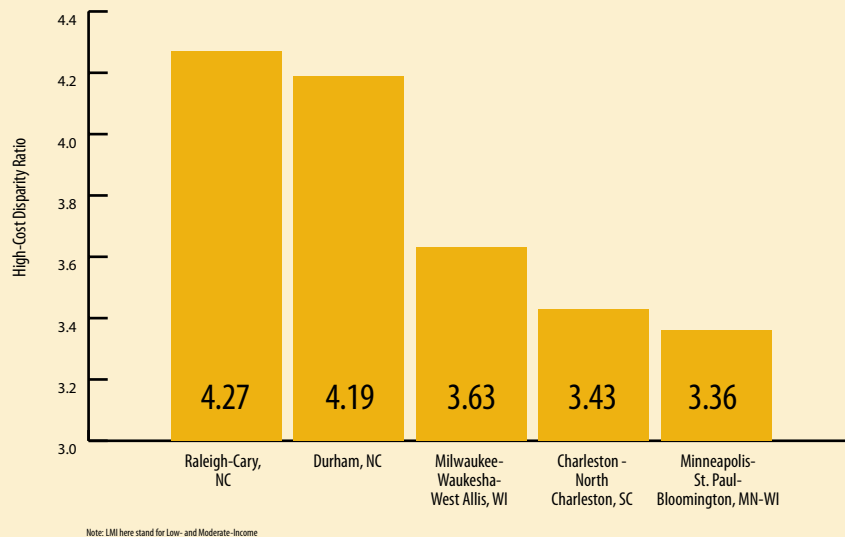

Lending to Middle- and Upper-Income Hispanic Females vs. Middle- and Upper-Income White Females

In 2007, almost 40 percent of the loans received by middle- and upper-income Hispanic females in Peabody, Massachusetts, were high-cost. In comparison, a little more than 9 percent of the loans received by middle- and upper-income white females in Peabody were high-cost. This indicates that middle- and upper-income Hispanic females were more than four times as likely to receive high-cost loans compared with their middle- and upper-income white counterparts (see Appendix Table 12).

Figure 11 illustrates the five metropolitan areas with the greatest racial/ethnic disparities in high-cost lending for middle- and upper-income Hispanic females vs. middle- and upper-income white females.

Sixty-two percent of all metropolitan areas examined had a high-cost disparity ratio of two or above for middle- and upper-income Hispanic females vs. middle- and upper-income white females. This indicates that middle- and upper-income Hispanic females were twice as likely to receive high-cost loans compared with their middle- and upper-income white counterparts. Similar to our findings for racial/ethnic disparities in lending to African Americans compared with whites, racial/ethnic disparities in lending increased as the income levels of Hispanic female borrowers increased (see Appendix Tables 2 and 4).

17

Bridgeport-Stamford-Norwalk, CT	3.00
San Jose-Sunnyvale-Santa Clara, CA	2.91
New Haven-Milford, CT	2.83

Note: LMI here stand for Low- and Moderate-Income
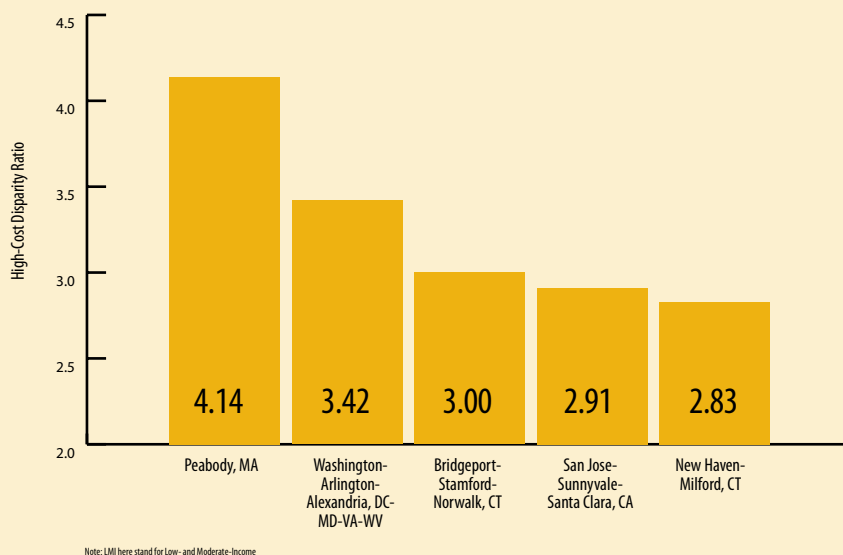

Lending to Low- and Moderate-Income African-American Males vs. Low- and Moderate-Income White Males

Racial/ethnic disparities in lending can also be observed for male borrowers. For low- and moderate-income African-American males, 67.5 percent of the metropolitan areas included in the analysis had a high-cost lending disparity ratio of two or above. This indicates that low- and moderate-income African-American male borrowers were twice as likely to receive high-cost loans compared with their low- and moderate-income white counterparts (see Appendix Table 13).

Four metropolitan areas had a high-cost disparity ratio greater than three. This indicates that low- and moderate-income African-American males were three times as likely to receive high-cost loans as their low- and moderate-income white counterparts.

The four metropolitan areas with a high-cost disparity ratio greater than three are:
1. Milwaukee-Waukesh-West Allis, WI
2. Charleston - North Charleston, SC
3. Chicago-Naperville-Joliet, IL
4. Minneapolis-St. Paul-Bloomington, MN-WI

Figure 12

Five MSAs with largest disparities in high-cost lending to Low- and
moderate-income African American vs. Low- and moderate-income White Males

Note: LMI here stand for Low- and Moderate-Income
Lending to Low- and Moderate-Income Hispanic Males vs. Low- and Moderate-Income White Males

Racial/ethnic disparities in high-cost lending were slightly less pronounced in low- and
moderate-income Hispanic males. In 14 out of 61 metropolitan areas examined, low- and
moderate-income Hispanic males were twice as likely to receive high-cost loans compared
with their low- and moderate-income white counterparts (see Appendix Table 14). Still,
low- and moderate-income Hispanic males were between 1.5 to 2 times more likely to
receive high-cost loans than their low- and moderate-income white counterparts in an
additional 25 metropolitan areas.

Figure 13 illustrates the five metropolitan areas with the greatest racial/ethnic disparities in
high-cost lending for low- and moderate-income Hispanic males vs. low- and moderate-
income white males.

Disparity Ratio is % African-American High Cost Loans / % White High Cost Loans
Note: LMI here stand for Low- and Moderate-Income
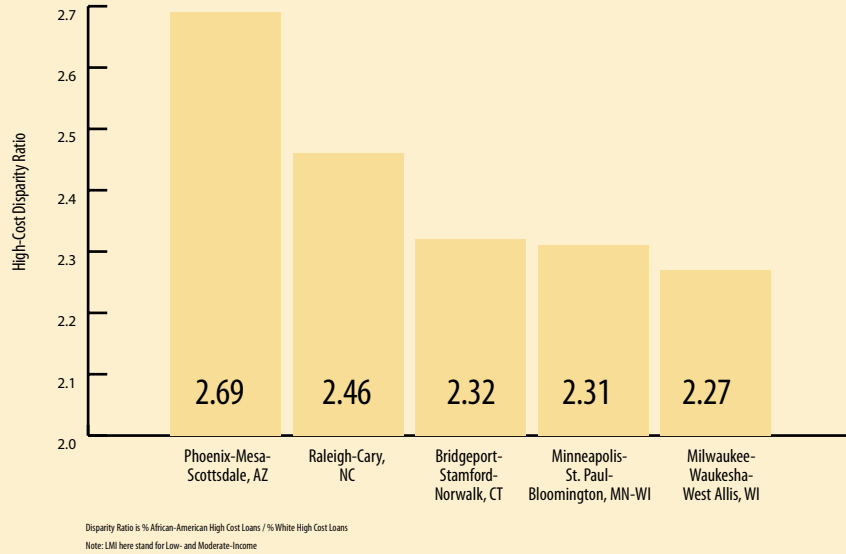

Lending to Middle- and Upper-Income African-American Males vs. Middle- and Upper-Income White Males

Eight of the metropolitan areas included in this analysis had a high-cost disparity ratio greater than three for middle- and upper-income African-American males vs. middle- and upper-income white males. This indicates that middle- and upper-income African-American males were more than three times as likely to receive high-cost loans as their middle- and upper-income white counterparts.
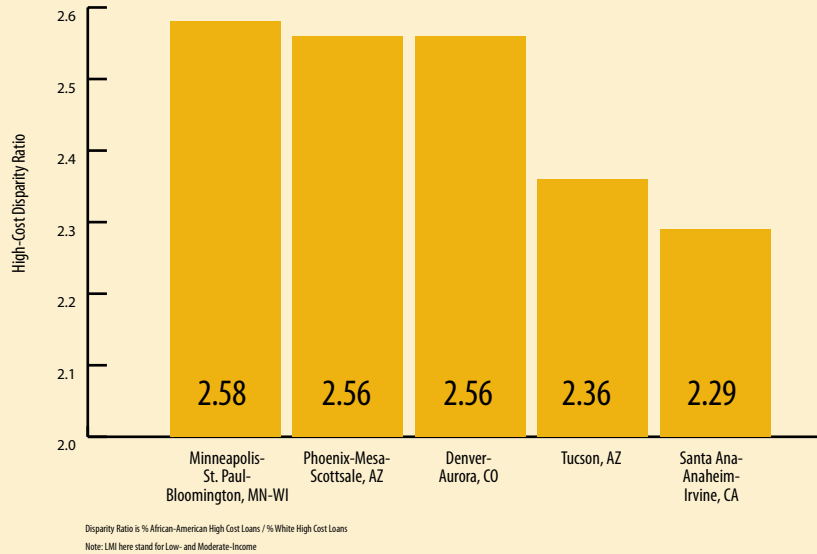

The majority of metropolitan areas examined (83.3 percent) had a high-cost disparity ratio of two or above. This indicates that middle- and upper-income African-American males were at least twice as likely to receive high-cost loans as their middle- and upper-income white counterparts (see Appendix Table 15). Low- and moderate-income African-American males were at least twice as likely to receive high-cost loans in 67.5 percent of the metropolitan areas examined as their low- and moderate-income white counterparts (see Appendix Table 15).

Figure 14 illustrates the five metropolitan areas with the greatest racial/ethnic disparities in lending for middle- and upper-income African-American males vs. middle- and upper-income white males.

Figure 14

Five MSAs with largest disparities in high-cost lending to Middle- and upper-income African-American vs. Middle- and upper-income White Males

High-Cost Disparity Ratio

Bridgeport-Stamford-Norwalk, CT	Durham, NC	Washington-Arlington-Alexandria, DC-MD-VA-WV	Milwaukee-Waukesha-West Allis, WI	Tuscaloosa, AL
3.91	3.69	3.6	3.57	3.21

Disparity Ratio is % African-American High Cost Loans / % White High Cost Loans
Note: LMI here stand for Low- and Moderate-Income
Lending to Middle- and Upper-Income Hispanic Males vs. Middle- and Upper-Income White Males

Racial/ethnic disparities in high-cost lending persisted as income levels increased for Hispanic males. Middle- and upper-income Hispanic males were at least twice as likely to receive high-cost loans as their middle- and upper-income white counterparts in 53 percent of the metropolitan areas examined (see Appendix Table 16). Low- and moderate-income Hispanic males were more likely to receive high-cost loans in just 23 percent of the metropolitan areas examined as their low- and moderate-income white counterparts.

Figure 15 illustrates the five metropolitan areas with the greatest racial/ethnic disparities in high-cost lending for middle- and upper-income Hispanic males vs. middle- and upper-income white males.

Figure 15

Five MSAs with largest disparities in high-cost lending to Middle- and upper-income Hispanic vs. Middle- and upper-income White Males

Disparity Ratio is % African-American High Cost Loans / % White High Cost Loans
Note: LMI here stand for Low- and Moderate-Income
Metropolitan Areas with the Greatest Racial/Ethnic Disparities in Lending

Each metropolitan area's final rank is based on an averaged score from the ranks that the metropolitan areas received when comparing groups of borrowers (see Appendix Table 17).

NCRC found that the top 10 metropolitan areas with the greatest racial/ethnic disparities in high-cost lending were:

1. Raleigh-Cary, NC
2. Minneapolis-St. Paul-Bloomington, MN-WI
3. Milwaukee-Waukesha-West Allis, WI
4. Bridgeport-Stamford-Norwalk, CT
5. Washington-Arlington-Alexandria, DC-MD-VA-WV
6. Chicago-Naperville-Joliet, IL
7. Cleveland-Elyria-Mentor, OH
8. Hartford-West Hartford-East Hartford, CT
9. Oakland-Fremont-Hayward, CA
10. Philadelphia, PA

22

Conclusion

This study demonstrates that high-cost lending is disproportionately targeted to minorities, and is especially pronounced as minorities earn higher incomes. Standard anti-trust theory suggests that when relatively few companies serve any group of consumers, that group of consumers is more likely to suffer abuses. Because minorities, regardless of income levels, receive a disproportionate amount of high-cost loans, NCRC offers the following programmatic and policy recommendations to combat predatory and abusive lending practices in minority communities.

Recommendations

Programmatic Partnerships

Counseling and foreclosure prevention programs must be increased to serve at-risk minorities, women, low- and moderate-income, and middle-income borrowers. Banks, community organizations, and public agencies should work together to establish programs for refinancing high-cost loans, non-traditional adjustable rate mortgages (ARM), and other problematic loans into lower-cost fixed-rate loans. Public agencies and the Federal Home Loan Banks can provide grants and low interest rate loans, when necessary, to assist borrowers with temporary cash shortfalls. The federal banking agencies reiterated in their recent revisions to the Interagency Questions and Answers regarding CRA that banks can earn points on their CRA exams when they engage in loan modifications and refinance borrowers into lower-cost loans.[24]

National Foreclosure Prevention

Stemming millions of additional foreclosures is an especially urgent need to restore the health of the financial markets and overall economy. To date, the industry-led voluntary

[24] See http://www.federalreserve.gov/BoardDocs/Press/bcreg/2007/20070417/default.htm, also see "The Community Reinvestment Act: Interagency Questions and Answers Regarding Community Reinvestment," Federal Register, Vol. 74, No. 3, Tuesday, January 6, 2009, pp. 498-542.

programs to prevent foreclosures have not kept pace with the increase in foreclosures across the country.

In order to overcome the barriers to large-scale loan modifications, NCRC proposed a program called Homeowners Emergency Loan Program or HELP Now in January 2008, under which the federal government would use its authority to purchase troubled assets at a steep discount (equal to roughly the current market rate) from investors. Working with the Federal Housing Authority, the Federal Home Loan Banks, Fannie Mae, and Freddie Mac, the government would facilitate modification of the problem loans and the selling of the loans back to the private sector. Updating on its HELP Now model, NCRC has also proposed that the federal government use the power of eminent domain and other viable options to purchase large volumes of distressed mortgages.[25]

The Obama Administration has enacted a large-scale economic recovery and reinvestment program to address the current economic crisis and jumpstart the economy. The Administration's new Home Affordable Modifications Program (HAMP) is the most comprehensive approach thus far, but it remains a voluntary program that provides monetary incentives to lenders, servicers, and borrowers to encourage financial institutions to modify mortgages and make them affordable for struggling borrowers. Congress passed the *Helping Families Save their Homes Act of 2009* (S. 896) that includes a retooling of the major federal government loan modification program HOPE for Homeowners. NCRC recommends that Congress and the Obama Administration work together to update their in-place strategies/programs to stem foreclosures and craft a more comprehensive foreclosure prevention program that incorporates the elements of NCRC's 2009 HELP Now proposal.

Comprehensive Anti-Predatory Lending Legislation

Since our analysis revealed a disproportionate amount of high-cost lending targeted to vulnerable borrowers and communities, Congress must respond by enacting comprehensive anti-predatory lending legislation. Comprehensive anti-predatory lending legislation would also strengthen CRA if regulatory agencies severely penalized lenders by assigning them failing CRA ratings when lenders violated the federal anti-predatory lending law.

In late 2007, Senator Dodd, the Chairman of the Senate Banking Committee, introduced S. 2452, the *Homeownership Preservation and Protection Act of 2007*. Senator Dodd's bill would prohibit steering or the practice of placing borrowers into high-cost loans when borrowers qualify for lower-cost loans. This report has demonstrated that steering likely occurs at a significant level in the marketplace. Senator Dodd's bill would also eliminate prepayment penalties and yield spread premiums on subprime loans and would require escrows for subprime loans. The bill would require prudent underwriting that would eliminate the dangerous practice of qualifying borrowers based on the initial low teaser rate on adjustable rate loans.

Rep. Barney Frank, Chairman of the House Financial Services Committee, Rep. Melvin Watt, and Rep. Brad Miller have introduced H.R. 1728 (*the Mortgage Reform and Anti-*

[25] See http://www.ncrc.org/images/stories/pdf/testimonies/tarp%20testimony.pdf.

24

Predatory Lending Act) that contain similar protections to Senator Dodd's bill but with limited liability for investors and other secondary market institutions. NCRC has been recommending ways to strengthen H.R. 1728, which was just passed by the U.S. House of Representatives. NCRC strongly recommends that Congress immediately pass S. 2452, a strengthened H.R. 1728, or a similar bill to prevent future foreclosure crises.

Regulatory Restructuring to Prevent Future Regulatory Failure

Predatory lending in the subprime market has been widely documented for more than a decade. Although hundreds of studies, policy papers, legislative testimony, refereed research articles, and print news stories documented the abusive lending practices, nothing was done to purge these practices from the housing and credit markets. Rather than purge predatory lending, federal regulatory policy made unfair and deceptive lending practices more harmful and prevalent in communities, especially communities of color. In response to a robust anti-predatory lending law enacted in Georgia in 2002, the Office of the Comptroller of the Currency ruled in 2004 that federal regulations preempted state law for nationally chartered banks in its entirety. This ruling undermined actions of dozens of states that attempted to protect the financial interest of their residents.

Despite widespread reports and documentation of unfair and deceptive lending practices, the Federal Reserve refused to tighten regulations under the *Homeownership and Protection Act* (HOEPA) until July 2008, when more than 2 million borrowers had already lost their homes, more than $400 billion in losses had been claimed by financial institutions, and the economy was heading into a recession. Even now, the revised rules leave many critical issues inadequately addressed.

NCRC believes the regulatory agencies must be held more accountable to Congress and the public at-large to avoid such glaring lax regulation and oversight in the future. Regulatory agencies must report annually to Congress on their enforcement actions and must hold annual public hearings in order to receive suggestions for enhancing oversight of financial institutions. Regulatory agencies must also be retooled so that they can effectively oversee all financial entities, including banks, investment banks, appraisal companies, servicers, rating agencies, and independent mortgage companies.

Fair Lending Enforcement Must Be Increased

In September of 2005, the Federal Reserve Board stated that it referred approximately 200 lending institutions to their primary federal regulatory agency for further investigations based upon the Federal Reserve's identification of significant pricing disparities in HMDA data.[26] An industry publication subsequently quoted a Federal Reserve official as stating that these lenders accounted for almost 50 percent of the HMDA-reportable loans issued in 2004.[27] In September of 2006, the Federal Reserve Board referred a larger number of lenders (270) to their primary regulatory agency for further investigations.[28]

25

[27] Inside Regulatory Strategies, November 14, 2005, p.2.

[28] Adler, J. "Big Increase in Lenders with Suspect HMDA Data." *American Banker*, September 11, 2006.

After the initial excitement, the public has not heard about the outcomes of the Federal Reserve Board's referrals. Not a single case of discrimination or civil rights violations have arisen from the Federal Reserve Board's referrals. Given the large share of lending represented by the financial institutions under investigation, the general public should receive an update of the status of these fair lending investigations from all the regulatory agencies. In addition, the federal agencies should annually report to Congress how many fair lending investigations they conducted, the types of fair lending investigations, and the outcomes of these investigations. Since the pricing disparities remain stubborn and persistent, fair lending investigations and enforcement must be strengthened.

Enhance the Quality of HMDA Data

NCRC believes that Congress and the Federal Reserve Board (which implements the HMDA regulations) must enhance HMDA data so that regular and comprehensive studies can scrutinize fairness in lending. More information in HMDA data is critical to fully explore the intersection of price, race, gender, age, and income.

The first area in which HMDA data must be enhanced is pricing information for *all* loans, not just high-cost loans. The interest rate movements in 2005 demonstrate the confusion associated with classifying the loans that currently have price information reported. Economists as well as the general public do not know whether to call the loans with price reporting, "subprime," "high-cost," or something else. If price were reported for all loans, the classification problems would be reduced. All stakeholders could review the number and percentages of loans in all the price-spread categories. The most significant areas of pricing disparities could be identified with greater precision.

HMDA data must contain credit score information similar to the data used in NCRC's "Broken Credit System" report released in the winter of 2003. For each HMDA reportable loan, a financial institution must indicate whether it used a credit score system and whether the system was their own or one of the widely used systems such as the Fair Isaac Corporation (a new data field in HMDA could contain 3 to 5 categories with the names of widely used systems). The HMDA data also would contain an additional field indicating in which quintile of risk the credit score system placed the borrower.

Another option is to attach credit score information in the form of quintiles to each census tract in the nation. That way, enhanced analyses can be done on a census tract level to illustrate whether pricing disparities still remain after controlling for creditworthiness. This was the approach adopted in NCRC's "Broken Credit System" and in studies conducted by Federal Reserve economists. Finally, HMDA data must contain information on other key underwriting variables including the loan-to-value and debt-to-income ratios as proposed by the *Community Reinvestment Modernization Act of 2009 (H.R. 1479)*. H.R. 1479 would also create a database on foreclosures and delinquencies that would be linked with HMDA data. This would be an important data enhancement resource that would help policymakers understand which loan terms and conditions (such as specific loan-to-value ratios and fixed or ARM loans) are more likely to be associated with delinquencies and foreclosures.

Strengthen CRA by Applying It to Minority Neighborhoods and All Geographical Areas Lenders Serve

In order to increase prime lending for minority borrowers and reduce lending disparities, CRA exams must evaluate the banks' records of lending to minority borrowers and neighborhoods, as well as scrutinizing banks' performance in reaching low- and moderate-income borrowers and neighborhoods. If CRA exams covered minority neighborhoods, pricing disparities in these neighborhoods would be reduced. The Federal Reserve Board, in its review of HMDA data, found that bank lending exhibited fewer disparities in geographical areas covered by their CRA exams than in areas not covered by their exams.[29] CRA's mandate of affirmatively meeting credit needs is currently incomplete as it is now applied only to low- and moderate-income neighborhoods, not minority communities.

CRA must also be strengthened so that depository institutions undergo CRA examinations in all geographical areas in which they make a significant number of loans. Currently, CRA exams assess lending primarily in geographical areas in which banks have their branches. But the overlap between branching and lending is eroding with each passing year as lending through brokers and correspondents continues to increase. NCRC strongly endorses the *Community Reinvestment Modernization Act of 2009*. This bill mandates that banks undergo CRA exams in geographical areas in which their market share of loans exceeds one-half of one percent in addition to areas in which their branches are located.

Short of statutory changes to CRA, NCRC believes that the regulatory agencies have the authority to extend CRA examinations and scrutiny to geographical areas beyond narrow "assessment" areas in which branches are located. Currently, the federal banking agencies will consider lending activity beyond assessment areas if the activity will enhance CRA performance. Likewise, the CRA rating must be downgraded if the lending performance in reaching low- and moderate-income borrowers is worse outside of the assessment areas.

CRA Must Be Expanded to Non-Bank Lending Institutions

Large credit unions and independent mortgage companies do not abide by CRA requirements. NCRC and Government Accountability Office (GAO) research concludes that large credit unions lag CRA-covered banks in their lending and service to categories of consumers including minorities, women, and low- and moderate-income borrowers and communities.[30] Unlike their counterparts, credit unions in Massachusetts are covered by a state CRA law. NCRC has also found that CRA-covered credit unions in Massachusetts issue a higher percentage of their loans to low- and moderate-income borrowers and communities than credit unions not covered by CRA. Therefore, NCRC believes that applying CRA to both large credit unions and independent mortgage companies using

the approach in the *Community Reinvestment Modernization Act of 2009* will increase their market-rate lending to low- and moderate-income borrowers.

CRA Exams Must Scrutinize Subprime and Non-Traditional Lending More Rigorously

Currently, CRA exams are not adequately assessing the CRA performance of subprime lenders. For example, the CRA exam of the subprime lender, Superior Bank, FSB, called its lending innovative and flexible before that thrift's spectacular collapse.[31] Previous NCRC comment letters to regulators have documented cursory fair lending reviews for the great majority of banks and thrifts involved in subprime lending.[32] If CRA exams continue to mechanistically consider subprime and non-traditional lending, lenders specializing in these types of loans will earn good ratings (since they tend to offer a larger portion of their loans to low- and moderate-income borrowers and communities than prime lenders).

To date, the federal regulatory agencies have amended CRA regulation to penalize banks if their lending violates federal anti-predatory law. However, NCRC has not seen rigorous and consistent action to implement this aspect of CRA regulation. Fair lending reviews that accompany CRA exams do not usually scrutinize subprime lending for compliance with anti-predatory law, for possible pricing discrimination, or whether abusive loans are exceeding borrower ability to repay. NCRC recommends that all CRA exams of subprime and non-traditional lenders must be accompanied by a comprehensive fair lending and anti-predatory lending audit. In addition, CRA exams must ensure that prime lenders are not financing predatory lending through their secondary market activity or servicing abusive loans.

Government Sponsored Enterprises (GSEs) Must Abide by Anti-Predatory Lending Safeguards

The Government-Sponsored Enterprises (GSEs) including Fannie Mae, Freddie Mac, and the Federal Home Loan Banks purchase more than half of the home loans extended on an annual basis. Therefore, it is vitally important that the GSEs adopt adequate protections against purchasing predatory loans. Fannie Mae and Freddie Mac have voluntarily adopted significant protections such as purchasing no loans with fees exceeding five percent of the loan amount, no loans involving price discrimination or steering, no loans with prepayment penalties beyond three years, and no loans with mandatory arbitration. The Department of Housing and Urban Development (HUD) has ruled that Fannie Mae and Freddie Mac will not receive credit towards their Affordable Housing Goals for any loans that contain certain abusive features such as loans with fees that are 5 percent or more of the loan amount.

HUD's ruling is an important step, but it needs to be enhanced. For example, HUD's ruling does not include disqualify loans with mandatory arbitration from counting towards the goals. The Federal Housing Finance Board, as the former regulator for the Federal Home Loan Banks, did not formally apply protections against abusive loans to the Home Loan Banks. The Federal Housing Finance Agency, the new regulator of the GSEs, must update the anti-predatory lending safeguards applied to GSEs.

The National Council of Negro Women

The National Council of Negro Women (NCNW) is a council of national African-American women's organizations and community-based sections. Founded in 1935 by esteemed educator and Presidential Advisor, Mary McLeod Bethune, the NCNW mission is to lead, develop, and advocate for women of African descent as they support their families and communities. NCNW fulfills this purpose through research, advocacy, and national and community-based services and programs on issues of health, education, and economic empowerment in the United States and Africa. With its 39 national affiliates and more than 200 sections, NCNW is a 501(c) 3 organization with an outreach to nearly four million women. Under the unwavering leadership of civil rights and women's rights icon Dr. Dorothy I. Height, NCNW continues to fulfill its mission as it swiftly approaches three quarters of a century of leadership and service.

The National Community Reinvestment Coalition

The National Community Reinvestment Coalition is an association of more than 600 community-based organizations that promote access to basic banking services, including credit and savings, to create and sustain affordable housing, job development, and vibrant communities for America's working families. Our members include community reinvestment organizations, community development corporations, local and state government agencies, faith-based institutions, community organizing and civil rights groups, minority- and women-owned business associations, and social service providers from across the nation. Their work serves primarily low- and moderate-income neighborhoods and communities.

The Board of Directors would like to express its appreciation to the NCRC professional staff who contributed to this publication, and continue to serve as an invaluable resource to all of us committed to promoting responsible lending and a Financially Inclusive Society.
